  - Due Thursday

#### **Predictive Parsers**

- Like recursive-descent but parser can "predict" which production to use
  - By looking at the next few tokens
  - No backtracking
- Predictive parsers accept LL(k) grammars
  - L means "left-to-right" scan of input
  - L means "leftmost derivation"
  - k means "predict based on k tokens of lookahead"
  - In practice, LL(1) is used

#### LL(1) vs Recursive Descent

- In recursive-descent,
  - At each step, many choices of production to use
  - Backtracking used to undo bad choices
- In LL(1),
  - At each step, only one choice of production
  - That is
    - When a non-terminal A is leftmost in a derivation
    - The next input symbol is t
    - There is a unique production A → α to use
      - Or no production to use (an error state)
- LL(1) is a recursive descent variant without backtracking

#### Predictive Parsing and Left Factoring

Recall the grammar

```
E \rightarrow T + E \mid T

T \rightarrow int \mid int * T \mid (E)
```

- Hard to predict because
  - For T two productions start with int
  - For E it is not clear how to predict
- We need to <u>left-factor</u> the grammar

#### Left-Factoring Example

Recall the grammar

$$E \rightarrow T + E \mid T$$
  
 $T \rightarrow int \mid int * T \mid (E)$ 

Factor out common prefixes of productions

$$E \rightarrow TX$$
  
 $X \rightarrow + E \mid \epsilon$   
 $T \rightarrow (E) \mid int Y$   
 $Y \rightarrow * T \mid \epsilon$ 

### LL(1) Parsing Table Example

Left-factored grammar

$$E \rightarrow TX$$
  $X \rightarrow + E \mid \epsilon$   
 $T \rightarrow (E) \mid int Y$   $Y \rightarrow * T \mid \epsilon$ 

The LL(1) parsing table: next input token

	int	*	+	(	)	\$
Ε	TX			ΤX		
Х			+ E		8	3
Т	int Y			(E)		
У		* T	ε •		3	ε

leftmost non-terminal

rhs of production to use

## LL(1) Parsing Table Example

- Consider the [E, int] entry
  - "When current non-terminal is E and next input is int, use production E → TX"
  - This can generate an int in the first position
- Consider the [Y,+] entry
  - "When current non-terminal is Y and current token is +, get rid of Y"
  - Y can be followed by + only if  $Y \rightarrow \epsilon$

#### LL(1) Parsing Tables. Errors

- Blank entries indicate error situations
- Consider the [E,\*] entry
  - "There is no way to derive a string starting with \* from non-terminal E"

#### Using Parsing Tables

- Method similar to recursive descent, except
  - For the leftmost non-terminal 5
  - We look at the next input token a
  - And choose the production shown at [5,a]
- A stack records frontier of parse tree
  - Non-terminals that have yet to be expanded
  - Terminals that have yet to matched against the input
  - Top of stack = leftmost pending terminal or non-terminal
- Reject on reaching error state
- Accept on end of input & empty stack

#### LL(1) Parsing Algorithm

```
initialize stack = <S $> and next
repeat
  case stack of
     \langle X, rest \rangle: if T[X,*next] = Y_1...Y_n
                        then stack \leftarrow <Y_1...Y_n rest>;
                        else error ();
     \langle t, rest \rangle : if t == *next ++
                        then stack \leftarrow <rest>;
                        else error ();
until stack == < >
```

## LL(1) Parsing Algorithm, marks bottom of stack

```
initialize stack = <S $> and next
                             For non-terminal X on top of stack,
   repeat
                             lookup production
      case stack of
         \langle X, rest \rangle : if T[X,*next] = Y_1...Y_n
                            then stack \leftarrow <Y<sub>1</sub>... Y<sub>n</sub> rest>;
                            else error ();
                                                           Pop X, push
         <t, rest> : if t == *next ++
                                                           production
For terminal t on top of ___then stack ← <rest>;
                                                           rhs on stack.
stack, check t matches next else error ();
                                                           Note
input token.
until stack == < >
                                                           leftmost
                                                           symbol of rhs
                                                           is on top of
                                                           the stack.
```

## LL(1) Parsing Example

Stack	Input	Action
E\$	int * int \$	TX
TX\$	int * int \$	int Y
int Y X \$	int * int \$	terminal
Y X \$	* int \$	* T
* T X \$	* int \$	terminal
TX\$	int \$	int Y
int Y X \$	int \$	terminal
Y X \$	\$	ε
X \$	\$	ε
\$	\$	ACCEPT

#### Constructing Parsing Tables

- Consider non-terminal A, production A → α, & token t
- $T[A,t] = \alpha$  in two cases:
- If α →\* † β
  - α can derive a t in the first position
  - We say that  $t \in First(\alpha)$
- If  $A \rightarrow \alpha$  and  $\alpha \rightarrow^* \epsilon$  and  $S \rightarrow^* \beta A + \delta$ 
  - Useful if stack has A, input is t, and A cannot derive t
  - In this case only option is to get rid of A (by deriving ε)
    - Can work only if t can follow A in at least one derivation
  - We say t ∈ Follow(A)

#### Computing First Sets

#### Definition

First(X) = { 
$$t \mid X \rightarrow^* t\alpha$$
}  $\cup$  { $\epsilon \mid X \rightarrow^* \epsilon$ }

#### Algorithm sketch:

- First(t) = { t }
- 2.  $\varepsilon \in First(X)$ 
  - if X → ε
  - if  $X \to A_1 \dots A_n$  and  $\epsilon \in First(A_i)$  for  $1 \le i \le n$
- 3. First( $\alpha$ )  $\subseteq$  First(X) if X  $\rightarrow$   $A_1 ... A_n <math>\alpha$ 
  - and ε ∈ First(A<sub>i</sub>) for 1 ≤ i ≤ n

#### First Sets. Example

Recall the grammar

$$E \rightarrow TX$$
  
 $T \rightarrow (E) \mid int Y$ 

$$X \rightarrow + E \mid \epsilon$$
  
 $Y \rightarrow * T \mid \epsilon$ 

First sets

```
First(() = {() First(T) = {int, (} First()) = {})} First(E) = {int, (} First(int) = { int } First(X) = {+, \epsilon} First(+) = {+} First(Y) = {*, \epsilon} First(*) = {*}
```

#### Computing Follow Sets

Definition:

Follow(X) = 
$$\{ + \mid S \rightarrow^* \beta X + \delta \}$$

- Intuition
  - If X → A B then First(B) ⊆ Follow(A) and
     Follow(X) ⊆ Follow(B)
    - if B →\* ε then Follow(X) ⊆ Follow(A)
  - If S is the start symbol then \$ ∈ Follow(S)

#### Computer Follow Sets continued

#### Algorithm sketch:

- \$ ∈ Follow(S)
- 2. First( $\beta$ ) { $\epsilon$ }  $\subseteq$  Follow(X)
  - For each production  $A \rightarrow \alpha \times \beta$
- Follow(A) ⊆ Follow(X)
  - For each production  $A \rightarrow \alpha \times \beta$  where  $\epsilon \in First(\beta)$

#### Follow sets. Example

Recall the grammar

$$E \rightarrow TX$$
  $X \rightarrow + E \mid \epsilon$   
 $T \rightarrow (E) \mid int Y$   $Y \rightarrow * T \mid \epsilon$ 

Follow sets

```
Follow(+) = { int, (} Follow(*) = { int, (} Follow(()) = { int, (} Follow(E) = {), $} Follow(X) = {$,)} Follow(T) = {+,), $} Follow() = {+,), $} Follow() = {+,), $} Follow(int) = {*,+,), $}
```

## Constructing LL(1) Parsing tables

- Construct a parsing table T for CFG G
- For each production A → α in G do:
  - For each terminal  $t \in First(\alpha)$  do
    - $T[A, t] = \alpha$
  - If  $\varepsilon \in \text{First}(\alpha)$ , for each  $t \in \text{Follow}(A)$  do
    - $T[A, t] = \alpha$
  - If  $\varepsilon \in First(\alpha)$  and  $\$ \in Follow(A)$  do
    - $T[A, \$] = \alpha$

#### Notes on LL(1) Parsing Tables

- If any entry is multiply defined then G is not LL(1)
  - If G is ambiguous
  - If G is left recursive
  - If G is not left-factored
  - And in other cases as well
- Most programming language CFGs are not LL(1)

#### Bottom-Up Parsing

- Bottom-up parsing is more general than topdown parsing
  - And just as efficient
  - Builds on ideas in top-down parsing
- Bottom-up is the preferred method
- Concepts today, algorithms next time

#### An Introductory Example

- Bottom-up parsers don't need left-factored grammars
- Revert to the "natural" grammar for our example:

$$E \rightarrow T + E \mid T$$
  
 $T \rightarrow int * T \mid int \mid (E)$ 

Consider the string: int \* int + int

#### The Idea

# Bottom-up parsing reduces a string to the start symbol by inverting productions:

#### Observation

- Read the productions in reverse (from bottom to top)
- This is a rightmost derivation!

```
int * int + int T \rightarrow int
int * T + int
T \rightarrow int * T
T + int
T \rightarrow int
T \rightarrow int
T + T
T + T
E \rightarrow T
T + E
E \rightarrow T + E
```

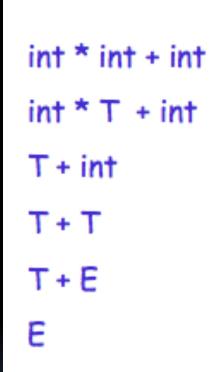

#### Important Fact #1

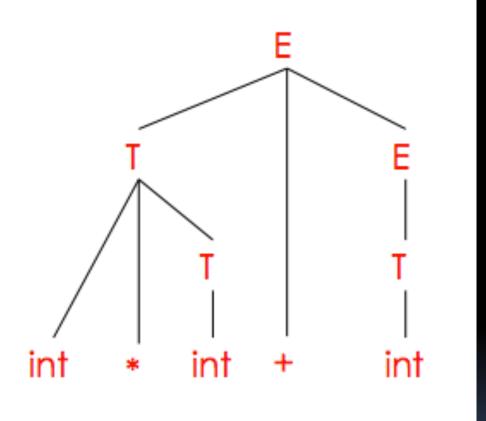

Important Fact #1 about bottom-up parsing:

A bottom-up parser traces a rightmost derivation in reverse

#### A Bottom-up Parse

## A Bottom-up Parse in Detail (1)

int \* int + int int \* int + int

## A Bottom-up Parse in Detail (2)

```
int * int + int
int * T + int
                            int
```

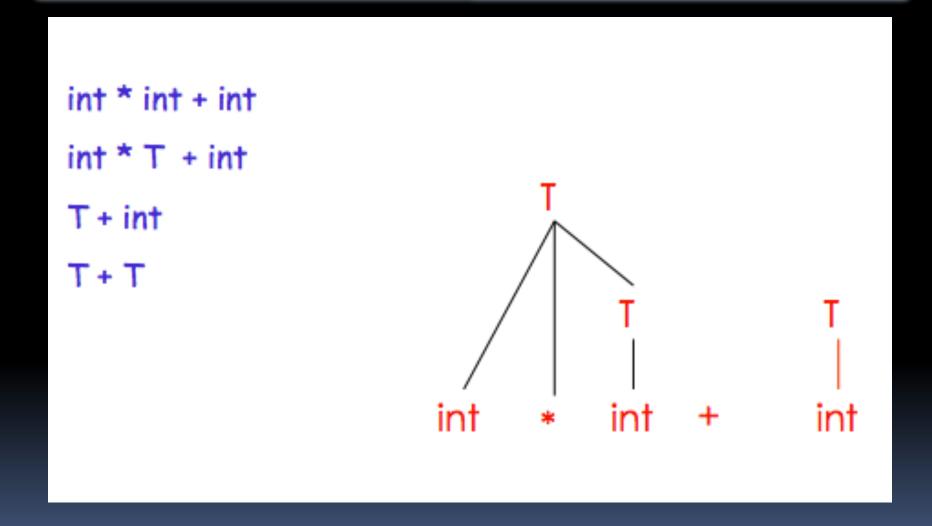

## A Bottom-up Parse in Detail (3)

```
int * int + int
int * T + int
T + int
```

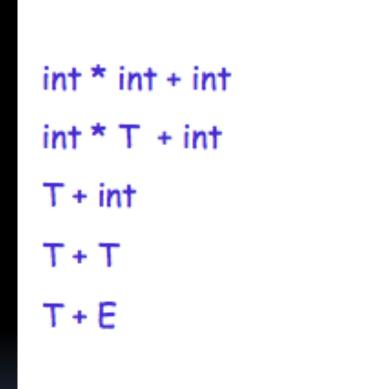

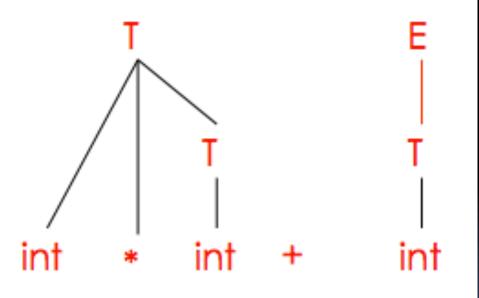

#### A Bottom-up Parse in Detail (4)

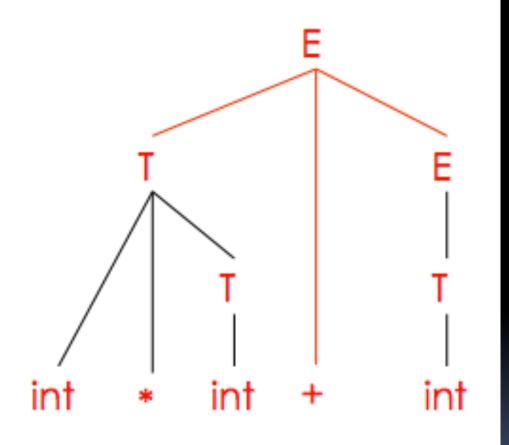

#### A Bottom-up Parse in Detail (5)

#### A Bottom-up Parse in Detail (6)

```
int * int + int
int * T + int
T + int
T + T
T+E
```

#### A Bottom-up Parsing Algorithm

```
Let I = input string
  repeat
      pick a non-empty substring \beta of I
            where X \rightarrow \beta is a production
      if no such β, backtrack
      replace one \beta by X in I
  until I = "S" (the start symbol) or all
  possibilities are exhausted
```

#### Where do Reductions Happen?

# Important Fact #1 has an interesting consequence:

- Let  $\alpha\beta\omega$  be a step of a bottom-up parse
- Assume the next reduction is by  $X \rightarrow \beta$
- Then w is a string of terminals

Why? Because  $\alpha X \omega \rightarrow \alpha \beta \omega$  is a step in a rightmost derivation

#### Notation

- Idea: Split string into two substrings
  - Right substring is as yet unexamined by parsing (a string of terminals)
  - Left substring has terminals and non-terminals
- The dividing point is marked by a |
  - The | is not part of the string
- Initially, all input is unexamined | x<sub>1</sub>x<sub>2</sub>...x<sub>n</sub>

# Shift-Reduce Parsing

Bottom-up parsing uses only two kinds of actions:

Shift

Reduce

#### Shift

- Shift: Move | one place to the right
  - Shifts a terminal to the left string

$$ABC|xyz \Rightarrow ABCx|yz$$

#### Reduce

- Apply an inverse production at the right end of the left string
  - If A → xy is a production, then

$$Cbxy|ijk \Rightarrow CbA|ijk$$

## The Example with Reductions Only

```
int * int | + int
                            reduce T \rightarrow int
int * T | + int
                            reduce T \rightarrow int * T
T + int |
                            reduce T \rightarrow int
T + T
                            reduce E \rightarrow T
T+E|
                            reduce E \rightarrow T + E
ΕI
```

## The Example with Shift-Reduce Parsing

```
|int * int + int
                           shift
int | * int + int
                           shift
int * | int + int
                           shift
int * int | + int
                           reduce T \rightarrow int
int * T | + int
                           reduce T \rightarrow int * T
T | + int
                           shift
T + | int
                           shift
T + int |
                           reduce T \rightarrow int
T + T
                           reduce E \rightarrow T
T + EI
                           reduce E \rightarrow T + E
Εl
```

# A Shift-Reduce Parse in Detail (1)

```
int * int + int
                    int * int +
                                          int
```

## A Shift-Reduce Parse in Detail (2)

```
int * int + int
int | * int + int
                      int * int +

T+E|
```

### A Shift-Reduce Parse in Detail (11)

#### The Stack

- Left string can be implemented by a stack
  - Top of the stack is the
- Shift pushes a terminal on the stack
- Reduce pops 0 or more symbols off of the stack (production rhs) and pushes a nonterminal on the stack (production lhs)

#### Conflicts

- In a given state, more than one action (shift or reduce) may lead to a valid parse
- If it is legal to shift or reduce, there is a shiftreduce conflict
- If it is legal to reduce by two different productions, there is a reduce-reduce conflict
- You will see such conflicts in your project!
  - More next time . . .
